

## Side float

Image 1: image inside the side float

An image is inserted at the beginning of the paragraph as fo:float.

Since DTP requires a person to compose layout page by page, work load increases proportionate of number of pages contained in a given document. In contrast, XSL formatting processes the prepared XML document as a batch.

To format XML using XSL requires development of a stylesheet. Work load is proportionate to the number of tag sets and the complexity of layout, not the number of pages.

## Side float

An image is inserted to the next line as fo:float.

An image is inserted at the end of the paragraph as fo:float.

Since DTP requires a person to compose layout page by page, work load increases proportionate of number of pages contained in a given document. In contrast, XSL formatting processes the prepared XML document as a batch.

To format XML using XSL requires development of a stylesheet. Work load is proportionate to the number of tag sets and the complexity of layout, not the number of pages.
